

# Renewable Energy Technologies

## Pre-design Project Advisory Service

Information on the vast array of low carbon, renewable energy technologies now available is ever increasing and most of it is highly complex.

The number of technologies and products to consider as well as the views and opinions of those promoting them can be very confusing, sometimes frightening, but it is inevitably a long term and expensive commitment you will be considering, so you want to get it right.

Most manufacturing and installation companies will advise on the technology they promote, but few are able to offer advice on all the available technologies and products, or will consider all micro-generation solutions for your project.

Before you can make decisions on which renewable energy system is best for you, which is worth the outlay, which is viable for your project and which is not, you must have a solid understanding of what each technology can do for you, what each will cost and how two or more might work in harmony to achieve your individual aims.

Planet Energy Solutions does exactly this. A one-to-one pre-design project consultation service aimed at delivering a solid understanding of the different technologies, in a private tuition atmosphere and in an un-cluttered manner, that focuses totally on your project.

A pre-design project meeting is generally carried out in one day at the site or architects office. It would typically consist of a site viewing in the morning, followed by a project appraisal meeting with the clients and designers, an explanation of each micro-generation technology and sustainable living option currently available, an outline of their capabilities and limitation. A filtering process would then follow to determine those solutions most desirable and suitable for consideration with an explanation on the reasons for exclusion of others, ending with a rough sizing and costing process to determine a 'menu' of options to take forward to the design stage.

Whether you are a domestic client wishing to learn more about the subject before you invest in your home, a private developer, Architect or M&E design practice requiring sustainable energy solutions to satisfy the changing low carbon and energy efficiency regulations, a charitable trust, small business or a 'Blue Chip' organisation embarking on an energy efficiency or carbon reduction program, we have experience of all these examples and this fast track advisory service may be sufficient to get you started.
